

Phase II and Phase III Archaeological Database and Inventory

Site Number: 18AG166

Site Name: Dorsey IV

Prehistoric

Other name(s)

Historic

Unknown

Brief Description:

Middle - Late Woodland village or hamlet

Site Location and Environmental Data:

Maryland Archaeological Research Unit No. 22

SCS soil & sediment code AhB2

Latitude 39.5923

Longitude -78.7643

Physiographic province Ridge and Valley

Terrestrial site

Underwater site

Elevation 195 m

Site slope 6-10%

Ethnobotany profile available

Maritime site

Site setting

-Site Setting restricted

-Lat/Long accurate to within 1 sq. mile, user may need to make slight adjustments in mapping to account for sites near state/county lines or streams

Topography

- Floodplain
- Hilltop/bluff
- Interior flat
- Upland flat
- Ridgetop
- Terrace
- Low terrace
- High terrace
- Rockshelter/cave
- Hillslope
- Unknown
- Other

Ownership

- Private
- Federal
- State of MD
- Regional/county/city
- Unknown

Summary Description:

The Dorsey IV site was examined as part of Phase II testing at Mexico Farms in Allegany County. The site and three others would potentially be impacted by the construction of new facilities at a federal prison complex in the area. Upon arrival at the site, researchers discovered that a significant portion of the site (around 80%) had been destroyed by construction of a parking lot for the Bayliner Marine Corporation. The county Department of Economic Development used the maps generated during Phase I research to plot the location of the site for avoidance when approving development in their industrial park. Apparently, these maps did not match up well with the extant remains of Phase I shovel test pits encountered by the Phase II crew and thus, it was discovered that the erroneous map had misled the Department of Economic Development and much of the site was paved over.

The site is situated just over 12 meters above the North Branch of the Potomac River on a broad upper terrace. Soils at the site include an Allegheny fine sandy loam and a few areas of poorly drained Tyler silt loam.

Initial Phase II shovel test pits were placed at 15.24 m (50 foot) intervals. Additional shovel tests were dug at 7.62 m (25 foot) intervals, in the four cardinal compass directions, around shovel tests yielding artifactual material. In addition to the shovel test pits, seven 1 X 1 m test units were subjectively placed throughout the site. Placement of test units was designed, in part, to gain an understanding of the distribution of artifacts, both in kind and quantity, through the site area. Artifacts were generally distributed throughout the site, but the highest concentrations tended to coincide with an area of ceramic concentration at the south end of the site.

Stratigraphic evidence from the site shows a plowzone overlying an intact cultural stratum which is approximately 20 cm thick below the plow layer. An intact midden containing a ceramic concentration was recorded along with other evidence of intact living floors below the plowzone.

192 ceramic sherds were recovered. Most were small sand or grit tempered sherds (56.3% and 23.4% of the assemblage respectively). Limestone, grog, and some quartz tempered sherds were also recovered, but no shell-tempered pottery was found. Five sherds had cordmarked surfaces.

A total of 374 lithic artifacts were collected. Most of these were black or grey chert flakes and debitage. One utilized biface, one drill tip, and one utilized flake complete the flaked stone assemblage and a single bipitted hammerstone was the only other lithic object encountered.

Historical artifacts include three fragments of aqua window glass, one cut iron nail, one unidentifiable iron nail, and several small brick fragments.

The only other objects recovered were 5 pieces of charcoal, two pieces of seeds/nuts, and one tiny quartzite chip.

Phase I research indicated that the site was likely a Middle Woodland or early Late Woodland village or hamlet based on the density and variety of artifacts indicative of some degree of permanency. The artifacts encountered during Phase II excavation bolster the argument for a "settled lifestyle", but ceramic assemblages (particularly a lack of shell-tempered and preponderance of sand-tempered sherds) indicate that an Early or Middle Woodland date is more likely. The 20 % of the site that remains is till considered a very valuable cultural resource.
