Summary Description:

The Hawk's Nest, site 18AG182, is a small short-term use camp of uncertain prehistoric age. The site is located on a fairly level to slightly sloping bench of Dans Mountain in Allegheny County, Maryland. It is not far from a similar site (18AG82). It surrounds a small spring which is likely to have attracted its occupants to that location. Two stone cairns of uncertain origin are noted on the site map, but are not discussed at all in the full site report. The date of their construction and their relation to the site are currently unknown. The site was originally located during the 1980s Western Maryland Coal Region survey.

To define the boundaries of the site, 20 shovel test pits (STPs) placed at 5 meter intervals were excavated on a grid pattern. These were followed by 4 two meter squares and a single one meter square in areas of artifact concentration. Soils were removed in arbitrary levels within natural soil horizons. The A horizon was excavated in 2 levels and the upper B horizon as a single unit. Excavations were terminated about 10 cm into sterile subsoil. Excavation revealed that the site remains relatively undisturbed and may not have been plowed at any time in the past. Perhaps a buffer was always left around the spring and cairns, while the fields of the surrounding bench were cultivated.

Three features were recorded on the site, all of which appear to be hearths. Each hearth consists of a shallow pit containing fire-cracked rock, flecks of charcoal, a few flakes, and (in one case) fire-reddened soil. Flotation samples and tools separated for blood residue analysis were taken from each feature (results of the blood residue work are not reported). A total of 424 artifacts were recovered from the site, all lithics. The assemblage consists of 2 projectile points, 3 bifaces, 2 cores, 2 retouched flakes, 5 utilized flakes, and 410 other lithic flakes. A majority of the material is cherty siltstone, with the remainder being either grey or black chert.

Flotation analysis produced 188 chert flakes along with a few fragments of bone, shell, and seeds. The linked ethnobotany profile provides additional details regarding the flotation results.

The site appears to have been utilized as a transitory camp during which time the spring area was used as a water source and tool resharpening and manufacturing was taking place. A large number of small retouch flakes were recovered evidencing that tool kit maintenance activities occurred in the vicinity of the hearths. Such camps were probably scattered along the ridges and mountain benches at convenient stopping points such as springs and small streams, during hunting and foraging trips. The age of the site is undetermined due to the lack of datable artifacts recovered. The point fragments found are stylistically ambiguous and too incomplete to render even an approximate age. However, the presence of intact features suggests that the site may have additional information to reveal and could potentially answer ongoing research questions relating to upland sites. In addition, the nature of the stone cairns is undocumented and warrants investigation. Further excavation could lead to better preserved features, clearly datable artifacts, and more apparent activity areas.
