Summary Description:

Field #240, site 18AG82, is a small short-term use camp of uncertain prehistoric age. The site is located on a fairly level to slightly sloping bench of Dans Mountain in Allegheny County, Maryland. The site was originally located during the 1980-81 coal region survey. At that time it was recorded on the basis of lithic debitage recovered from several shovel test pits in an open meadow. The site appeared to be relatively undisturbed and, thus, the survey researchers determined to undertake Phase II testing.

To define the boundaries of the site, 52 shovel test pits (STPs) placed at 10 meter intervals were excavated on a grid pattern. Results of the STP excavations indicated a few areas of artifact concentration. These areas were explored further by excavating 5 one meter and 6 two meter squares. Squares were placed in order to maximize the amount of information derived from the site. All but two were placed in areas of artifact concentration. By doing so, a greater sample of artifacts could be collected from the site and inferences concerning the nature of activities could then be made.

With recovery of 797 lithic artifacts from the site, a fairly homogenous assemblage, inferences about site activities are fairly simple. The testing conducted revealed 3 apparent chipping clusters within a 60 by 60 meter section of the site, but no formal features were encountered. Most of the artifacts were confined to the plow zone with a few recovered from immediately below (upper B horizon soils). Consequently, discrete activity areas were not discernable. In spite of the plow zone mixing of artifacts on the site, it appears to be a single short-term occupation. The age of the site is uncertain due to the lack of clearly datable artifacts. The only complete projectile point recovered has a rather ambiguous form which could be placed in a Late Archaic, early or Middle Woodland time frame. The lithic assemblage consists mainly of flake debitage and contains some evidence of on-site bifacial tool manufacturing (bifaces and 2 projectile points). A few cores were also recovered, indicating that roughed-out cores and quarry blanks were transported to the site from sources downslope, probably the North Branch Valley where chert outcrops are abundant. Artifacts include 3 points or point fragments, 2 bifaces, 4 cores, 1 scraper, 4 utilized flakes, 1 retouched flake, and 782 other flake/debitage fragments. The lithic material was primarily a cherty siltstone, followed by grey and black cherts.

The nature of the site seems to indicate that it was created by a relatively brief occupation, during which siltstone blanks (unavailable in the uplands) were brought to the site and worked into a more complete form. Little more can be said with the data at hand. The only advantage further excavation might hold is to produce more clearly datable artifacts (if they even exist at the site) or to uncover a pit feature which has been only partially disturbed by the plow. Sites such as 18AG82, with few interpretable remains and minimal assemblage variety are common throughout the western Maryland uplands.
