Brief Description:

prehistoric lithic reduction site

Site Location and Environmental Data:

Maryland Archaeological Research Unit No. 7

SCS soil & sediment code

Latitude 39.1735

Longitude -76.7182

Physiographic province Western Shore Coastal

Terrestrial site

Underwater site

Elevation 43 m

Site slope

Ethnobotany profile available

Maritime site

Site setting

-Site Setting restricted

-Lat/Long accurate to within 1 sq. mile, user may need to make slight adjustments in mapping to account for sites near state/county lines or streams

Topography

- Floodplain
- Hilltop/bluff
- Interior flat
- Upland flat
- Ridgetop
- Terrace
- Low terrace
- High terrace
- Rockshelter/cave
- Hillslope

Summary Description:

The Arford Site (18AN1162) is a prehistoric lithic reduction site located near Hanover in northern Anne Arundel County, Maryland. The site is situated on a wooded hillslope above an unnamed tributary of Piney Run, just west of the Baltimore Washington International (BWI) Airport. The site was forested with some heavy underbrush when it was first discovered in 1999. Soils at the site are primarily Sassafras fine sandy loams.

The site was first identified in 1999 as the result of a Combined Phase I/II investigation of a 116 acre area either owned or of interest to the Maryland Aviation Administration west of the BWI Airport. The work was conducted in the fall of that year to determine the impact of potential development of the area, related to airport operations. The nature of future development plans required archeological investigation to assess any potential adverse effects to any cultural resources present under Section 106 of the National Historic Preservation Act, and Article 83B, paragraph 5-618 (g) of the Annotated Code of Maryland.

Phase I work in the vicinity of 18AN1162 entailed the excavation of 8 systematic shovel test pits (STPs) at 20 meter intervals. STPs were excavated according to stratigraphic layers and all excavated material was passed through hardware cloth screens for uniformity of artifact recovery. Both prehistoric and historic artifacts were recovered. Prehistoric densities were low, generally 5 artifact or fewer per shovel test, although one STP did produce 12 artifacts. Most historic material was recovered from the two upper soil strata, prehistoric material was recovered through a fourth soil stratum. Initial survey results suggested deep cultural deposits in this area which were mixed throughout. Based on these findings, the decision was made to proceed to a Phase II level of testing.

Phase II work entailed the excavation of a single 1 X 1 m test unit to examine soil stratigraphy and site integrity. Phase II investigations indicated that most prehistoric materials were found beneath the two upper soil strata, with some historic material mixed at the interface, and very little intrusive historic material in the main prehistoric strata. Thus, prehistoric deposits appeared to retain good integrity, and might represent lengthy prehistoric use of the area. No features were identified in the unit. In all but the surface stratum, coal was at least half of the historic assemblage recovered from any excavation level. Coal was the only historic material present beneath the third soil stratum. As these were sandy soils, some vertical migration of small smooth artifacts (like glass and coal) should be anticipated.

All prehistoric artifacts recovered from the Arford site were quartz except for two quartzite flakes, a tested quartzite cobble, and an ironstone flake. The combined Phase I and II prehistoric assemblage from 18AN1162 included a quartz biface fragment, 2 utilized flakes, 125 other flakes, 5 chunks, 1 tested cobble, and 73 pieces of shatter. Roughly 30% of all flakes retained cortex.

Some historic material was recovered from the Arford Site (189 objects). The bulk of the assemblage (129 objects) consists of coal or coal by-products. Most other material was consistent with light modern surface scatter. Other historic materials recovered included agricultural lime (1 fragment counted as an activity item), 23 brick fragments, 2 pieces of window glass, asphalt, 4 nails, mortar, a white glass button, 16 ceramic sherds (15 whiteware, 1 redware), 5 pieces of bottle glass, 1 piece of oyster shell, 2 pieces of corroded metal, and 2 charcoal fragments.

Site 18AN1162 yielded 207 prehistoric lithic artifacts. These finds consisted mostly of flakes and shatter and were temporally undiagnostic. While upper soil horizons contained a mixture of prehistoric artifacts and historic field scatter, the lowest cultural level appeared to include only prehistoric material. However, the prehistoric finds have rather little potential to provide significant archeological information. Therefore, MHT concluded that 18AN1162 is not a significant archeological resource.
