

# Phase II and Phase III Archaeological Database and Inventory

Site Number: 18AN285

Site Name: Smithsonian Pier West

Prehistoric

Other name(s) Wright # R/F-3

Historic

Brief Description:

Middle Woodland - Late Woodland shell midden

Unknown

## Site Location and Environmental Data:

Maryland Archaeological Research Unit No. 7

SCS soil & sediment code 33) MvC2

Latitude 38.8932 Longitude -76.5406

Physiographic province Western Shore Coastal

Terrestrial site

Underwater site

Elevation m Site slope 6-10%

Ethnobotany profile available  Maritime site

Site setting

-Site Setting restricted  
-Lat/Long accurate to within 1 sq. mile, user may need to make slight adjustments in mapping to account for sites near state/county lines or streams

### Topography

- Floodplain
- Hilltop/bluff
- Interior flat
- Upland flat
- Ridgetop
- Terrace
- Low terrace
- High terrace
- Rockshelter/cave
- Hillslope
- Unknown
- Other
- Shoreline

### Ownership

- Private
- Federal
- State of MD
- Regional/county/city
- Unknown

### Nearest Surface Water

Name (if any) Rhode River

#### Saltwater

Ocean

Estuary/tidal river

Tidewater/marsh

Minimum distance to water is 0 m

#### Freshwater

Stream/river

Swamp

Lake or pond

Spring

## Temporal & Ethnic Contextual Data:

## Summary Description:

Smithsonian Pier West (18AN285) is a Middle to Late Woodland shell midden located south of Edgewater in Anne Arundel County, Maryland. The site is situated on a broad low terrace along the shore, and near the mouth, of the Rhode River. The Rhode River is a tributary of the nearby Chesapeake Bay. Embayed Creeks are situated to the north and south. The water is brackish and there are no fresh water sources nearby, except seasonal or intermittent streams in shallow ravines to the north and south of the site. Although cleared and under cultivation in the middle of the 17th century and later, two phases of secondary forest growth now cover most of the surrounding landscape. Larger tulip poplar and sweet gum trees cover most of the area, with smaller locust, sweet gum, oak, elm, and tulip poplar in the western portions of the site area. Ground cover is heavy throughout, consisting of honey suckle, wild grape, poison ivy, greenbriers, and other low shrubs and climbing vines. The Rhode River would have provided a wide range of food resources, including fish, shellfish, waterfowl, leafy plants, tubers, and terrestrial and marine mammals and reptiles. The nearby Chesapeake Bay and its tributaries would also have served as a natural corridor for transportation, communication, and trade. Soils at the site are well-drained loamy soils with fine sand of the Marr-Westphalia-Sassafras association, subject to severe erosion, particularly on slopes. These well drained soils would have been attractive to both prehistoric and historic peoples.

The site was first identified in 1967, by Henry T. Wright of the University of Michigan. At the request of the Smithsonian Institution, Wright conducted a survey of two land tracts that the Smithsonian had recently acquired and on which they would be developing what was then called the Chesapeake Bay Center for Field Biology. The survey would document sites on the properties, which might otherwise be unwittingly damaged by future development of the Center.

Wright's 1967 work consisted primarily of a walkover survey of the two tracts. Visibility was poor, as much of the formerly plowed landscape was overgrown and treefalls, animal burrows, and other opportunistic subsurface exposures were rare. Nonetheless, two concentrations of shell were noted along a terrace near the mouth of the Rhode River. These two shell heaps were designated the Smithsonian Pier Site (18AN284) and Smithsonian Pier West (18AN285). Future researchers would eventually determine that these two sites were really one very large midden and subsequent practice has been to consider the entire midden 18AN284. That practice is followed here. See the synopsis report for 18AN284 for a synthesis of the work conducted at this large shell midden (18AN284/18AN285).
