Brief Description:

prehistoric lithic scatter

Unknown

External Samples/Data:

Collection curated at Anne Arundel County Planning & Zoning

Additional raw data may be available online

Summary Description:

Site 18AN657, or the Green Spring #4 Site, is a lithic scatter of unknown prehistoric affiliation near Pasadena in Anne Arundel County, Maryland. The site is situated in a fallow agricultural field. When the site was first identified in the 1980s, erosion was evident on the slopes and paths that criss-cross the area. Some lumbering has occurred and an old farm road cuts through the site. The head of an unnamed intermittent tributary to Main Creek is situated to the northeast of the site. Soils in the area are primarily of the Evesboro-Rumford-Sassafras association with some Muikirk loamy sand also occurring in some pockets.

The site was examined during a Combined Phase I, and II -level research project in 1988 for the Green Spring development project. The project area entailed a large parcel in northern Anne Arundel County planned for subdivision and housing development. The work was completed to fulfill mitigation requirements mandated by legislation of the Anne Arundel County Planning and Zoning Division.

Phase I fieldwork at Green Spring was divided into two methods, conducted concurrently, according to the amount of visibility and site potential in the particular area. Anywhere exposed areas existed (road cuts, erosional cuts, rodent burrows, and tree falls), the surface area was carefully examined. In addition, shovel test pits (STPs), 40-50 cm in diameter at the surface, were excavated to sterile subsoil in the areas of highest site potential and in one area of 0% visibility and moderate to low site potential. All excavated soils were passed through hardware cloth and recorded on standardized forms, and each STP was drawn to scale in profile. A total of 85 Phase I STPs were completed throughout the entire Green Spring project area, however, none of these identified 18AN657. The site was, instead, identified through surface finds.

Artifacts identified during Phase I work at 18AN657 included an early-stage quartz biface and a quartz core. A pile of historic broken and worn quartz and quartzite, along with historic refuse piles are also present at the surface near a bend in the road that crosses the site. Based on these findings, the project proceeded directly to a Phase II-level of research.

Phase II work entailed the establishment of a grid over the area that produced artifacts during Phase I. This systematic grid, with 7.62 m (25 ft) intervals, was then extended in all four directions using a transit, compass, and tape off of magnetic north. Shovel test pits were then excavated using the same methods employed during Phase I on the 7.62 m interval. A total of 26 STPs were excavated during Phase II work. It should be noted that no formal test units (such as 1 X 1s) were excavated at 18AN657 during Phase II work.

Close interval shovel testing at 18AN657 yielded 9 prehistoric artifacts, all flaked lithic objects. They included 2 quartz flakes, 1 quartzite flake, 4 quartz shatter fragments, a heated piece of quartz and a heated piece of quartzite. The artifacts were recovered from the two uppermost strata at the site to a depth of 40-50 cm below surface. No diagnostics were recovered, no artifact concentrations were noted, and no features were encountered. The historic refuse piles and stone deposits appear not to have been investigated further.

Archeological site 18AN657 is a prehistoric lithic scatter of unknown age. Based on the lack of diagnostics, lack of features, and relative dearth of artifact, the site does not appear to have any significant research potential.
