Site Number: 18AN660

Site Name: Green Spring #12

Prehistoric

Other name(s)

Historic

Brief Description:

prehistoric lithic scatter, 19th-20th century artifact scatter

Unknown

## Site Location and Environmental Data:

Maryland Archaeological Research Unit No. 7

SCS soil & sediment code

Latitude 39.1162

Longitude -76.4795

Physiographic province Western Shore Coastal

Terrestrial site

Underwater site

Elevation 18 m

Site slope 0

Ethnobotany profile available

Maritime site

Site setting

-Site Setting restricted

-Lat/Long accurate to within 1 sq. mile, user may need to make slight adjustments in mapping to account for sites near state/county lines or streams

### Topography

- Floodplain
- Hilltop/bluff
- Interior flat
- Upland flat
- Ridgetop
- Terrace
- Low terrace
- High terrace
- Rockshelter/cave
- Hillslope
- Unknown

Collection curated at Anne Arundel County Planning & Zoning

Additional raw data may be available online

## Summary Description:

Site 18AN660, or the Green Spring #12 Site, is a lithic scatter of unknown prehistoric affiliation near Pasadena in Anne Arundel County, Maryland. The site is situated on generally level interior land, a fallow agricultural field. When the site was first identified in the 1980s, erosion was evident on the slopes and paths that criss-cross the area. Some lumbering has occurred and an old farm road runs to the northwest of the site. The head of an unnamed freshwater tributary to Main Creek is situated to the northwest of the site. Soils in the area are primarily of the Evesboro-Rumford-Sassafras association with some Muikirk loamy sand also occurring in some pockets.

The site was examined during a Combined Phase I, and II -level research project in 1988 for the Green Spring development project. The project area entailed a large parcel in northern Anne Arundel County planned for subdivision and housing development. The work was completed to fulfill mitigation requirements mandated by legislation of the Anne Arundel County Planning and Zoning Division.

Phase I fieldwork at Green Spring was divided into two methods, conducted concurrently, according to the amount of visibility and site potential in the particular area. Anywhere exposed areas existed (road cuts, erosional cuts, rodent burrows, and tree falls), the surface area was carefully examined. In addition, shovel test pits (STPs), 40-50 cm in diameter at the surface, were excavated to sterile subsoil in the areas of highest site potential and in one area of 0% visibility and moderate to low site potential. All excavated soils were passed through hardware cloth and recorded on standardized forms, and each STP was drawn to scale in profile. A total of 85 Phase I STPs were completed throughout the entire Green Spring project area, however, none of these identified 18AN660. The site was, instead, identified through an isolated surface find (flaked quartz). Based on these findings, the project proceeded directly to a Phase II-level of research.

Phase II work entailed the establishment of a grid off of the isolated surface find. The systematic grid, with 7.62 m (25 ft) intervals, was then extended in all four directions using a compass off of magnetic north. Shovel test pits were then excavated using the same methods employed during Phase I, but were situated systematically every 7.62 m or 15.24 m (50 ft), depending on whether or not artifacts were being recovered. One STP would be dug 15.24 m away from the last artifact bearing STP, and then 2 more STPs would be dug at 7.62 m from the first to ensure that the boundaries of the site had been located (assuming each turned up sterile). A total of 9 STPs were excavated during Phase II work. It should be noted that no formal test units (such as 1 X 1s) were excavated at 18AN660 during Phase II work.

Close interval shovel testing at 18AN660 yielded 9 quartz artifacts. They included 1 core, 2 flakes, and 7 pieces of shatter. The artifacts were recovered from 4 distinct strata to a depth of about 35 cm below surface. No diagnostics were recovered and no features were encountered. Historic artifacts (coal and glass) were also found in the strata with the prehistoric artifacts. These appeared to be small wash deposits from historic activities around a nearby standing house. The site was defined as a roughly circular scatter, about 22.86 m (75 ft) in diameter.

Archeological site 18AN660 is a prehistoric lithic scatter of unknown age. Based on the lack of diagnostics, lack of features, and relative dearth of artifact (as well as admixture with historic artifacts), the site does not appear to have any significant research potential.
