Summary Description:

The Johnson Site (18AP59) is a deposit of archeological remains associated with the urban history of Annapolis, Maryland, and specifically associated with a mid-19th century standing structure at 77 State Circle in downtown Annapolis. The structure is situated at the corner of State Circle and Maryland Avenue and in modern times has served a commercial function as Johnson's Clothing Store. The building appears to have been built between 1850 and 1860, based on historical birds-eye view maps of the area. The landscape of the site is heavily developed as an urban area. Soils at the site are Collington and Wist sandy loams as well as some human transported soils.

The first documented archeological work at the site occurred in the winter of 1989-1990. Archaeology in Annapolis, a cooperative program between the University of Maryland, College Park and the Historic Annapolis Foundation, conducted the excavations in order to satisfy the conditions for compliance set forth in the Annotated Code of Maryland, Article 83b, sections 5-617 and 5-618, prior to the undergrounding of electrical wires by the City of Annapolis. Funding for what was known as the State Circle Archaeological Project was provided by a matching grant from the Maryland State Department of General Services and the City of Annapolis.

A single 91 X 152 cm (3 X 5 ft) test unit was excavated on this site to look for possible early edges of State Circle and post holes associated with a mid 19th century fence located at this site in historic photos. Excavation attempted to recover information about earlier levels of the circle. The unit was also opened in order to recover any earlier corners of Maryland Avenue (a radial street) and State Circle. The unit was located in the road bed of State Circle next to the curb with its long axis parallel with State Circle and its short axis perpendicular to Maryland Avenue. It was excavated to an average depth of 1.08 m (3.54 ft).

The brick paving covering the surface of the excavated unit was removed using a jackhammer, and then any underlying concrete was removed by the same means or with sledge hammers. Following this, the unit was excavated by shovel skimming and troweling in natural stratigraphic levels: allowing for precise definition of chronological sequences and feature identification. However, if a stratigraphic level was greater than 15 cm (6 in) in depth, the layer was excavated in arbitrary levels. Soil removed during hand excavation was screened through hardware cloth with the exception of substantial fill levels primarily of 20th century origin. These were sampled, with approximately 33% of fill being screened. The excavated unit was then backfilled in several 15 cm levels which were each tamped by a mechanical tamper before additional fill was added. Features and profiles exposed during excavation were mapped in place. Both soil samples and flotation samples were taken from all intact cultural layers, but no report of their analysis is available at MHT.

Excavation revealed that construction of the extant 20th century road surface between 1902 and 1904 resulted in the deposition of three stratigraphic levels (the brick paving, a sand bed, and a concrete bed respectively). Portions of thicker, steel-reinforced concrete may be associated with later repair jobs to both State Circle and Maryland Avenue, or it may be associated with a water main located near the unit. The next level (Level D) contained a lot of brick rubble and small pieces of broken granite. It may be associated with a Belgian Block road surrounding State Circle between 1882 and 1902. The paving for this road surface was completely removed when the 20th century brick road was laid. The next level encountered (Level E) was interpreted as the road bed in use on State Circle between 1858 and 1882. Below this was a level of fill associated with the construction of the dirt road bed noted in Level E. Because this layer (Level F) bottoms out on clay sand interpreted as subsoil, it is probable that earlier levels of State Circle were graded away after the middle of the 19th century during construction of new road surfaces.

The artifact catalog provided in the full site report for the State Circle project is coded. Unfortunately, a legend is not provided. A total of 163 miscellaneous objects were retained from the excavations at 18AP59.

Excavation at this location attempted to recover earlier edges of State Circle, particularly the remains of a fence, which was once located on this lot. Research here also attempted to explore the relationship of State Circle and one of its radial streets (Maryland Avenue). However, no edges of Maryland Avenue, or State Circle were recovered. However, data retrieved at this location could be linked to strata form nearby sites to create long profiles used in the interpretation of the three dimensional changes to State Circle.

The excavations at 18AP59 provided limited data on the evolution of the road system near the State House. The site appears to have very limited potential to provide additional data capable of answering research questions related to Maryland's history.
