Summary Description:

The Blue Banks Site (18CH696) is an 18th-19th century frame house site in the Nanjemoy area of Charles County, Maryland. The site is situated on a first terrace flat amidst bluffs overlooking the Potomac River. Vegetation is largely covered by older growth mixed forests of hard and soft woods, with little understory in some locations and thick understories of young Paw Paw and green brier in other locations. Land use within the area is primarily regrowth timber, although a few residential areas are situated northeast of the site. Soils at the site are primarily Piccowaxen loams and Keyport silt loams.

The site was first examined in the summer of 2000, when the site was identified for development into the proposed Maryland Rock Douglas Point Sand and Gravel Quarry. The project was subject to Charles County development regulations, as well as to State of Maryland and Federal requirements, and, thus, archeological investigation was required to assess any potential adverse effects to any cultural resources present.

Phase I survey investigations on the first terrace flat above the Potomac River in the vicinity of the proposed quarry consisted of 134 shovel test pits (STPs) placed at 20 meter and 10 meter intervals. STPs were excavated by natural strata to a depth of 10 cms into sterile subsoil. All excavated soils were screened through hardware mesh, and all artifacts, including modern materials, were collected. All materials collected were provenienced by horizontal provenience and soil strata. Most of the STPs excavated during the survey investigations produced no cultural material. Although prehistoric resources had been anticipated, only isolated finds were encountered, and the entire test area produced only 11 prehistoric artifacts. A single historic period site was encountered during the survey, located in the center of the test area. This site produced 156 of the 165 historic artifacts recovered during the survey investigations. A brick rubble feature was identified during Phase I work.

For the most part, Phase II testing centered around a large associations this large association of bricks (Phase I, Feature 1) encompassing roughly a 20 by 21 meter area. This brick feature initially appeared to be a disassociated redeposition of bricks dumped from another location, but Phase II work appeared to validate the possibility that the bricks were the remains of a structure. During the Phase II investigations, three subsequent feature designations were given to specific portions of the larger brick scatter. The brick scatter was investigated with the excavation of four 1 X 1 meter test units. Test units were excavated using 10 cm arbitrary levels within natural soil layers. Exposed elements of the feature and at least one wall of each unit were photographed and mapped in profile. Excavated soils were screened through hardware cloth.

Phase II, Feature 1 was a heaped pile of bricks at the northwest corner of the scatter, interpreted as the collapsed remains of a chimney stack or brick wall. The feature soils were artifact rich, and yielded ceramic fragments, bone, shell, glass, mortar, and nails. Phase II, Feature 2 was a linear pile of bricks in the southern portion of the brick concentration. It actually consisted of two layers of disarticulated bricks, but no evidence of a foundation wall was found. This feature yielded a large amount of nails and other pieces of corroded metal, ceramic sherds, glass, shell, bone, and several pieces of mortar. Phase II, Feature 3 was identified as a 2.7 by 1.5 meter area of articulated brick paving located in the southeast corner of the brick scatter containing two distinct patches of brick flooring. In the feature fill on top of or between bricks, a sizeable collection of nails, as well as bone and ceramic fragments were recovered.

No final artifact catalog resulting from this research project has been provided to MHT. Thus, no tally of artifacts is available in this synopsis or in the table of artifacts above. The full site report does mention that the bulk of materials recovered during Phase I and II investigation at 18CH696 were from the late 18th and 19th centuries. Because of the limited nature of our understanding of the site, little can be said about its remaining research potential. It is recommended that if the site cannot be avoided, researchers return to the locale to conduct additional mitigation work.
