## Summary Description:

Little can be said definitively about the McCain II site (18FR144). The site was first identified in the late 1970s as part of a Phase I surface survey for the McCain Loop of the Allegheny Power Service Corporation's electrical transmission line in Frederick County, Maryland. However, the site was apparently known to collectors prior to that as Donald Peck documented artifacts from local collections which were identified as coming from this hilltop. The collections he viewed contained a Morrow Mountain I point and a Selby Bay side-notched (Variant B).

The site is located very near one of the electrical line's supporting towers and prior to the tower's construction, Phase II test excavations were carried out. The Phase II work involved the excavation of two 2 X 2 m test units, each centered directly over one of the tower's two support poles. While a broken quartzite projectile point, a broken rhyolite projectile point, and a broken rhyolite blank were recovered during Phase I survey, no prehistoric artifacts were encountered during the test excavations. Two pieces of modern bottle glass, a single piece of dark green bottle glass, and a fragment of cow bone were recovered in the test units.

Phase I survey in 2005 for the proposed Jefferson Technology Park relocated the site. Three flakes were identified during shovel testing, but no other cultural materials have ever been encountered. Thus, the site is of limited value for research and is likely a simple lithic scatter of Late Archaic age (based on the points documented by Peck).
