Summary Description:

Site 18FR27 is a sizeable rockshelter situated along Tuscarora Creek, near the Yellow Springs area of Frederick County, Maryland. A log-built hunting lodge was once located on top of the large rock outcropping below which the shelter is located. The log cabin burned down in 1968, but the site is still referred to as the Log Cabin Rockshelter. Early Archaic, Late Archaic, and Late Woodland occupations are present at the site, as well as a possible Middle Archaic deposit. The site was first discovered and tested in 1959 by Spencer O. Geasey, a prominent member of the Archeological Society of Maryland. He later revisited the site and conducted data recovery during the years 1973-1974. The shelter is formed by the weathering and breakdown of the quartzite outcropping. It opens to the west, and therefore offers minimal protection from the elements. It is approximately 10.7 meters (35 ft) wide and offers an overhang of as much as 4.57 meters (15 ft). Near the mouth of the shelter, the ceiling is nearly 6.7 meters (22 ft) high and slopes downward to the back of the shelter. There is some spring seepage at the back of the shelter.

Geasey excavated the center of the shelter to an average depth of 30.5 cm (12 in). Rock fall at the northern end of the shelter and soil erosion to the south precluded excavation in these areas. Details regarding the excavations and sampling strategy are not provided in the full site report, but it is reported that the majority of artifacts were recovered from a depth of 15.25 to 20.32 centimeters (6 to 8 in). No features were identified at the site.

Artifacts recovered from 18FR27 include 15 rhyolite and 1 brown chert projectile point, 12 rhyolite bifaces, 1 rhyolite drill, 1 rhyolite core, 1 quartz core, 6 utilized rhyolite flakes, an unidentified flaked stone object made of jasper, 12 fragments of quartz debitage, and at least 2,000 pieces of rhyolite debitage. Seven of the projectile points are diagnostic; 2 Mountindale points, 1 Otter Creek, 1 Bare Island, 2 Savannah River stemmed points, and 1 Late Woodland elongate triangular point. In addition to the flaked stone artifacts, three stones with battered surfaces (apparent hammerstones), 3 split and charred fragments of animal bone, and a few fragments of charcoal were recovered.

The presence of a great quantity of rhyolite debitage indicates that the site served as a chipping station and sometime campsite. However, the lack of substantial faunal refuse and features for all periods, and the lack of pottery for the Woodland period, would seem to indicate that occupations were sporadic and short-lived. The fact that the shelter is exposed to the west, likely discouraged more permanent habitation at the site. Barring the mechanical removal of rockfall in the northern portions of the site (which may preserve intact deposits beneath them), the site's research potential has probably been exhausted.
