Summary Description:

Site 18FR325 is an apparent late 19th century exploratory limestone quarry pit. It is located within the Catoctin Furnace Historic District, along US Route 15 in Frederick County, Maryland. The local limestone served as a flux material used in the production of iron in the furnaces at Catoctin. Thus, there are many similar limestone quarries scattered throughout the region.

The site was first discovered during the 1977 Phase I survey associated with the dualization of US Route 15. State Highway Administration maps of the area did not depict the quarry and it was unknown to researchers at the time the survey began. It was thoroughly concealed by the vegetation in the area. It consisted of a partially exposed limestone outcrop faced by a 12.192 X 12.192 meter (40 X 40 ft) box-like depression approached by a 3.66 meter (12 ft) ramp. Once it was discovered, Phase II work was planned to determine what the purpose of the quarry was and to determine if any artifact were in the vicinity which could fix the date of the quarry's use.

A backhoe dug an irregular trench across the face of the outcrop to a depth of 1.8288 meters (6 ft) below the surface of the depression. Quantities of limestone chips came from the lower level of the trench. These chips bore evidence of being produced by the use of an iron hammer or maul on the outcrop. Quantities of green bottle glass, a three legged iron pot, and a probable kerosene tin were found along with charcoal. Refuse chips similar to those found in the quarry were found scattered on the ground surface nearby. Examination by a project geologist revealed that this particular limestone outcrop contained several impurities making it a poor choice for a source of flux.

Artifacts of probable 19th century age recovered at 18FR325 include 2 charred branch fragments, 9 limestone spalls, 1 clear piece of window glass, 2 anthracite coal fragments, 1 piece of coal ash, a 3 legged iron pot fragment (of a type commonly produced at Catoctin), and a probable ribbed kerosene can with a spout. Twentieth century artifacts from the site include a piece of metal electrical housing, 1 piece of metal wire, 4 bottle glass fragments, 5 wood chips, and an iron screw.

The site was interpreted as an apparent late 19th century experimental digging to obtain limestone for use as flux in the Catoctin furnace. Larger pieces of crushed limestone, mauled from the outcrop, were removed for this purpose, and the debris scattered over the nearby ground. The miners, apparently ate their lunches in and around the depression leaving charred wood, iron pot, and bottle fragments. Kerosene was used to start fires for any cooking. Only a small area of the outcrop was removed. The quarry was probably abandoned due to the lack of suitable quality limestone. Oral history informs us that in the last days of the furnace, considerable testing for ingredients to use in the furnaces took place. The site has no additional research potential.
