## Summary Description:

The QF6 Site (18FR653) is an apparent Late Archaic lithic scatter situated on the western bank of the Monocacy River, east of Frederick, Maryland. The site is situated on Hagerstown gravelly loam soils. Sometime prior to 1990, the site was recorded as a possible or suspected prehistoric site by staff at the Maryland Geological Survey Office of Archeology (now the MHT).

The site was first investigated during the Phase II portion of the Monocacy Interceptor Sewer Line project in 1990. Because of the possibility that a prehistoric site was present at QF6, it was automatically considered for Phase II work. Fourteen shovel tests and two 1 X 1 m units were excavated within possible prehistoric site QF6. One auger test was placed in the site; it extended to 125 cm below the surface. An additional 18 shovel tests were planned for an area that was recently plowed. It was determined that a controlled surface collection would be more productive in this area.

No cultural materials were recovered either from the shovel tests or from the excavation units. Subsurface testing also revealed no evidence of intact cultural deposits. However, the surface collection recovered two unmodified flakes, one core, one utilized flake, and a Brewerton corner notched projectile point.
