Summary Description:

Site 18GA126 was first located in 1980 as part of Robert D. Wall's survey of prehistoric sites in the Western Maryland Coal Region. The site is situated on a small run, which flows into the nearby Casselman River. The dominant soil type at the site is Purdy silt loam. An unspecified number of test units yielded a total of 37 lithic flakes in this initial study.

In 1987-1988, three days were spent investigating the site during which time 21 shovel tests and 3 one-meter squares were dug. Results of the tests showed a fairly shallow plow zone containing a large amount of apparently fire-cracked rock, a few stone tool fragments, and a number of small retouch flakes. One projectile point, 1 biface edge, and 1 bifacially worked flake were recovered, along with 141 flakes, 1 split cobble, and 38 pieces of fire-cracked rock. No features and no diagnostic artifacts were encountered and the site is described as a prehistoric lithic scatter. It is possible that continued work on the site may yield some chronological information, i.e. when the site was occupied, however, the poor soil context (all is mixed in the plow layer) on the site and lack of definable features greatly lessens the significance of the site.
