Summary Description:

Youghhegheny Lake Bottom Site Number 1 (18GA301) is a possible base camp, hamlet, and/or village. Soils at the site consist primarily of sandy loams. The artifacts recovered from the site consist of Late Archaic and Woodland lithics. There are probably numerous buried, intact occupations within this extensive floodplain surface. Scatters of fire-cracked rock and flakes have been observed along the edge of the present reservoir as well as along the old river channel which is evident after drawdown each year.

Surface collections obtained as part of the Western Maryland Coal Region work, provided further support for the presence of prehistoric camps along the river. Since good floodplain contexts for such sites are rare in the Maryland coal region, it was decided to excavate four 1 X 1 m test units shortly after drawdown.

The initial surface collection yielded 2 projectile points, 2 biface fragments, 2 utilized flakes, 57 flakes, and 1 piece of cobble shatter. Two of the four units yielded artifacts. The first unit contained 90 artifacts (all flakes) in a plowzone which reached a depth of 27cm. Underlying this was a horizon of reddish-brown sandy clay loam. This soil horizon terminated on a bed of river cobbles at around 60 cm below the surface. The second test unit yielded 6 flakes and 1 projectile point. The point (described as Late Archaic) was found in a sandy loam B horizon context. It is difficult to tell whether the point is in situ or was redeposited during a flooding event. The soil profile in this unit shows a plowzone overlying a yellow-brown sandy loam which turns into a reddish sandy loam with depth. It is quite possible that deeper cultural components are present within the sandy clay loam stratum. No artifacts were found in the 3rd or 4th test unit.

Lithic raw material frequencies include tan chert (76), gray chert (60), siltstone (14), black chert (5), rhyolite (1), and quartzite (1).

This work was just an initial effort to describe the stratigraphy of the site and its immediate surroundings. Further work should include additional test units on the upper and lower terraces of the river floodplain, including deeper units on the lower terrace. This may be one of the more significant floodplain occupation sites in the Youghioghenny Valley in Maryland.
