Summary Description:

The Rodeheaver site (18GA304) is located north of Oakland, Maryland in Western Garrett County. The site is located on an upland plateau, between two tributaries of the Youghiogheny River. Soils underlying the project area are in the Dekalb-Calvin-Gilpin association, stony soils formed over red to gray sandstone and shale.

The site was first identified during Phase I survey of several sites that the United State Air Force was considering for installation of Ground Wave Emergency Network (GWEN) radio communications towers. The Phase I work consisted of shovel testing and surface collection of the recently plowed site and identified a number of lithic artifacts, including one diagnostic. The diagnostic artifact was a possible Shriver Expanded Stem projectile point, dating to the Middle to Late Archaic Period. These results suggested that the site may be prehistorically significant and Phase II testing was undertaken to determine the site's eligibility to the NRHP.

Phase II work conducted in 1990 began by testing two areas in which concentrations of lithic materials were identified during the Phase I project. A pedestrian survey of the plowed areas of the site was also conducted concurrently with the opening of 1 m X 1 m test units in these heavy concentration areas. Shovel test pit excavations were used to help delineate the boundaries of the site in the easternmost section, where vegetation hampered surface visibility. In all, ten 1 m X 1 m units were hand excavated.

Four lithic concentrations were identified, but appeared more alike than different in their material remains. No features were encountered. No intact or undisturbed strata existed above the sterile subsoil and artifact deposits seemed heavily intermingled by plowing.

In total 278 artifacts were recovered from the Phase II investigations at 18GA304. A total of 189 prehistoric lithic artifacts were encountered and 87 historic objects (mostly coal, cinders, and slag). Most of the prehistoric lithic objects were unutilized flakes or debitage (147). There were 32 retouched/utilized flakes, 1 uniface, 2 cores, 2 lithic debris chunks, and 5 bifacially worked tools (two other bifaces were recovered during Phase I work). Of the bifaces, only three are diagnostic (in addition to the one Shriver point mentioned above). One has large sections of its base and tip removed, but the mid-section resembles Kirk-like forms. The other two appear to be Kirk stemmed points.

Again, the remaining artifacts are mostly miscellaneous historic objects. Only thirteen objects are not coal, cinders, or slag. At least five of these objects represent kitchen activities (pieces of clear and amber colored bottle glass, and whiteware) and the rest consists of plastic and unidentifiable metal.

Analysis at 18GA304 showed that neither vertical nor horizontal distinctions could be made from collections taken from different parts of the site. Plowing had severely compromised the integrity of deposits. As a result, the only information that could be obtained from the Rodeheaver site was a description of the artifact collection as a whole. The high percentage of small, unutilized flakes found at 18GA304 suggests that this hilltop location may have been used as a tool maintenance and re-sharpening station. Very little in the way of tool manufacturing was encountered. Other lithic tools at the site suggest that hunting and butchering activities may have also taken place at Rodeheaver. The Kirk stemmed points, which date to the Early Archaic, and the Shriver Expanded Stem point (Phase I), which probably dates to the Middle to Late Archaic, indicate that site 18GA304 was probably used through the Archaic Period by small hunting parties who utilized the site to view game and sharpen their tools.
