Brief Description:

Early Archaic lithic scatter

Site Location and Environmental Data:

Maryland Archaeological Research Unit No. 24

SCS soil & sediment code PuC2

Latitude 39.6763

Longitude -79.1878

Physiographic province Allegheny Plateau

Terrestrial site

Underwater site

Elevation 659 m

Site slope 6-10%

Ethnobotany profile available Maritime site

Nearest Surface Water

Name (if any) N. Br. Casselman

Saltwater

Ocean

Estuary/tidal river

Tidewater/marsh

Minimum distance to water is 92 m

Freshwater

Stream/river

Swamp

Lake or pond

Spring

Site setting

-Site Setting restricted

-Lat/Long accurate to within 1 sq. mile, user may need to make slight adjustments in mapping to account for sites near state/county lines or streams

Topography

- Floodplain

Summary Description:

The Kingsinger Site (18GA68) in Garrett County, MD is a possible Early Woodland lithic scatter. The site is situated on the banks of the Casselman River, south of the town of Grantsville. It occupies a terrace overlooking the river and was first identified by the presence of flakes and a few tool fragments that had been encountered on the surface. The site was first investigated in the late 1980s as part of the Western Maryland Coal Region study in the hopes that the surficial finds were an indication that sealed deposits would be encountered on site. This did not turn out to be the case.

Four field days were spent conducting test excavations. A systematic surface collection was first performed to determine the location of artifact concentrations. During the reconnaissance a serrated point fragment, two other projectile points, and a bifacial tool fragment were collected along with a scatter of flakes. This was followed by the excavation of 9 shovel test pits on the upper terrace to determine the depth of the plowzone and basic soil stratigraphy. Shovel tests revealed a plow zone varying in depth from 25-32 cm and an orange to tan sandy silt B horizon. Very few artifacts were recovered from these tests.

Six 1 meter test units were subsequently dug along a north-south base line running perpendicular to the course of the river. This allowed the test units to effectively cross section all levels moving from the flood chute at the base of the terrace to the terrace's highest elevation. This work revealed that despite a visually obvious terrace sequence on the site, the soils are fairly young and have little potential to contain in situ archeological components. No cultural features were encountered.

Artifacts recovered from the site include 3 projectile points, 1 biface, 2 bifacially worked flakes, 3 utilized flakes, 44 flakes, 1 block flake, 1 block, and 1 hammerstone. The majority of the lithic raw material consisted of gray to black cherts and cherty siltstone. One of the points may be Early Archaic, but the remainder are too fragmented and stylistically indistinct to determine the age. The meagre recoveries and poor soil context suggest that the site has little research potential.
