Brief Description:

Late Archaic or Early Woodland lithic scatter

Unknown

## Site Location and Environmental Data:

Maryland Archaeological Research Unit No. 12

SCS soil & sediment code

Latitude 39.1780

Longitude -77.4388

Physiographic province Eastern Piedmont

Terrestrial site

Underwater site

Elevation 123 m

Site slope 0

Ethnobotany profile available

Maritime site

Site setting

-Site Setting restricted

-Lat/Long accurate to within 1 sq. mile, user may need to make slight adjustments in mapping to account for sites near state/county lines or streams

### Topography

- Floodplain
- Hilltop/bluff
- Interior flat
- Upland flat
- Ridgetop
- Terrace
- Low terrace
- High terrace

## Summary Description:

Boquelea Prehistoric Lithic Scatter (18MO378) is a dispersed scatter of prehistoric lithic artifacts located in an agricultural field near Poolesville in Montgomery County, Maryland. The site is situated east of the Potomac River on an upland flat. The nearest source of freshwater is situated approximately 455 meters to the north. Soils at the site are grouped under the Penn-Lewisberry soil association.

The site was first identified during a Phase I survey for the planned Montgomery County Site 2 Landfill. This study was conducted in 1991 as part of the county's transition from a traditional landfill-centered waste disposal system to a waste-to-energy based program. Currently, Montgomery County disposes of their waste by burning it at extremely high temperatures, and then using the heat to generate energy as either electricity or steam. This reduces the volume of the trash by nearly 90% leaving only ash and metals. The metals are then removed via a magnet and recycled reducing waste further. Currently the ash waste is shipped by rail out-of-county for disposal in landfills. However, in 1991, as the county's extant Oaks landfill built in 1982 was nearing the end of its use-life, plans for the disposal of the ash that would be generated in the new plant led to the purchase of a large tract (including Site 18MO378) for the construction of a new landfill. While this landfill has still not been constructed, the Montgomery County governments purchased the needed property for the landfill's eventual construction and currently lease it for tenant farming. All archeological research was conducted in anticipation of state permitting and possible Army Corps of Engineers wetlands permitting that will eventually be required whenever the construction project is realized.

Following its initial discovery, the site was investigated by non-systematic surface search and collection of the artifacts that were present. Lithics at the site were scattered over an area measuring about 227 meters by 18 meters. The observed density of artifacts was about one per five square meters at places where artifacts were observed. The material collected during Phase I survey consisted of a broken projectile point that resembled the "Piscataway" type in configuration. Other artifacts recovered were a quartzite primary flake fragment and a fragment of shattered quartz. Due to the limited nature of artifact recovery, further study of this site was required to identify its content, integrity, and boundaries and to interpret its chronology and function.

Researchers returned to the site in 1993 to conduct Phase II testing. The testing began with a systematic surface collection. Visibility was good because the agricultural field where the site is located had been recently plowed. Following the surface survey, 9 shovel test pits (STPs) were excavated at intervals of 7.5 meters. STPs were no less than 30 cm in diameter and were excavated to the depth of natural subsoil by natural/cultural levels. They were centered on the location that had produced the projectile point during the Phase I survey. That location was also excavated with a single 2 X 2 meter test unit. The 2 X 2 was excavated by natural/cultural levels. All soils (both STPs and the excavation unit) were screened through hardware cloth.

The Phase II fieldwork resulted in the recovery of 19 prehistoric lithic artifacts. These included 1 unfinished slate point, 1 quartz biface, 1 quartzite scraper, 6 quartzite and 4 quartz debitage flakes, 4 quartz shatter fragments, and 2 pieces of fire-cracked rock. No historic artifacts are reported from 18MO378.

The archeological investigations at 18MO378 resulted in the recovery of only one artifact that may be chronologically diagnostic. This was the broken Piscataway point recovered during Phase I work of Late Archaic to Early Woodland vintage. This site may represent a temporary camp or other short-term cultural activity. The depositional context of the site has been disturbed by agricultural activity. No intact subsurface cultural features were encountered at this site. Further study of 18MO378 would not provide significant information to Maryland prehistory.
