Summary Description:

The High Point Site, 18PR14, is an apparent short-term resource procurement site of probable Archaic/Woodland age near Beltsville in Prince George's County, Maryland. The site is situated on a terrace above Paint Creek and consists of two artifact concentrations separated by a small draw. Soils at the site were sandy loams of an unspecified type.

The site was discovered in the late 1960s, when highway workers building a new interchange for I-95 encountered prehistoric artifacts in the project right-of-way. Staff from the Maryland Geological Survey responded and conducted salvage operations in 1969 and 1970. To date, no formal report of these excavations has been written and details of the archeological work conducted are sketchy at best.

Testing included the excavation of 2 test units in 1969 and 7 additional units in 1970. The 1969 test units were 70 cm X 150 cm and 1 m X 1 m respectively. All of the units excavated in 1970 were 1 m X 1 m in size. Again, the notes related to the excavation are scant, but a typical profile from the site appears to have consisted of approximately 10 cm of topsoil overlying a 20 cm thick sterile soil strata (possibly historic fill) that capped a thin (approx. 10 cm) lens of light grayish-brown sandy loam containing flecks of charcoal. Beneath this lens, a 25 cm thick strata containing most of the cultural materials recovered from the site was encountered. Sterile subsoil was found beneath this cultural layer. The site was identified because a road cut had penetrated this cultural layer exposing prehistoric artifacts. The only feature encountered is believed to be natural in origin; a rodent burrow.

No artifact inventory is known to exist, however, site forms and notes indicate that a stemmed point, a medium-sized side-notched point, and at least 3 unidentified points/bifaces were recovered along with quartz, black chert, and rhyolite flakes. Quartz pebbles and cobbles were also encountered. Given the limited nature of what is known about the site assemblage, the artifact tallies in the table above are minimal estimates.

Researchers from MGS concluded that the site was of Archaic or Woodland age based on the presence of the notched and stemmed projectile points, but do not describe any diagnostic artifact types in site files. Correspondence about the site seems to suggest that portions of it may remain preserved between the highway right-of-way and a more modern parking lot constructed on an adjoining property. Given the unknown nature of 18PR14, a site visit could be helpful in determining the potential of the site to address ongoing research questions related to Maryland prehistory.
