

Phase II and Phase III Archaeological Database and Inventory

Site Number: 18WA443

Site Name: Mountaintop II

Prehistoric

Other name(s)

Historic

Unknown

Brief Description:

prehistoric short-term camp, lithic quarry/extraction

Site Location and Environmental Data:

Maryland Archaeological Research Unit No. 18

SCS soil & sediment code ReD

Latitude 39.6523

Longitude -77.5332

Physiographic province Blue Ridge

Terrestrial site

Underwater site

Elevation m

Site slope 15-25%

Ethnobotany profile available

Maritime site

Site setting

-Site Setting restricted

-Lat/Long accurate to within 1 sq. mile, user may need to make slight adjustments in mapping to account for sites near state/county lines or streams

Topography

- Floodplain
- Hilltop/bluff
- Interior flat
- Upland flat
- Ridgetop
- Terrace
- Low terrace
- High terrace
- Rockshelter/cave
- Hillslope
- Unknown
- Other

Ownership

- Private
- Federal
- State of MD
- Regional/county/city
- Unknown

Summary Description:

This site was first identified during Phase I surface collections in the vicinity in preparation for the replacement of the existing Reid-Thurmont 138kV electric line with the proposed Allegheny Power System's Ringgold-Liberty 138kV line. A rhyolite stemmed projectile point and 11 fragmented bifaces were found lying along the surface of a narrow access road paralleling the transmission line right-of-way. Because the integrity of the site was uncertain, and impact to the site could not be avoided during construction, Phase II testing was recommended to ascertain site boundaries, significance, chronology, and integrity.

The Mountaintop II site (18WA443) is located along the edge of a slightly sloping ridgetop and moderately precipitous slopes near Little Antietam Creek and within the right-of-way of an electric transmission line. Soils at the site consist of Highfield stony loam, a moderately eroded and very gravelly or channery silt loam.

To establish the physical limits of the site, the Phase II testing strategy centered around excavating 50 X 50 cm shovel test pits on a 5-meter grid across the area where artifacts were found during the Phase I Survey. Since artifacts were also recovered from the surface of the entire access road extending along the hillslope during the Phase I survey, the entire hillslope was tested to determine the site limits within the proposed right-of-way. A total of 74 STPs were excavated across the locus. The site appears to be confined to a small area of rhyolite outcropping comprised of boulders and blocks that had been prehistorically quarried. The Phase I artifacts found in the access road apparently eroded from the quarry area or had been transported downslope by road traffic. Therefore, the site was limited to an approximately 50 square meter area within the project right-of-way. Based on the site size and apparent disturbances, only one 2 X 2 meter unit was excavated within the outcropping to examine site integrity.

A total of 91 artifacts were recovered during the Phase II testing, all by-products of prehistoric quarrying/knapping activities associated with the small rhyolite outcropping. All of the material was recovered from the 2 X 2 meter test unit (this unit incorporated the shovel test pit which yielded two bifaces) excavated in the center of the outcropping. Visual examination of the rhyolite artifacts revealed that the specimens were of relatively good quality raw material exhibiting minor to moderate weathering. Included in the rhyolite artifact assemblage were 20 primary flakes, 13 biface fragments, and 58 modified blocks.

Based on these findings, one can say that the site served as a locus of rhyolite quarrying from the small exposed outcropping. Unfortunately, little else can be said since road grading, construction-related activities associated with modern activity at the site. No finished tools or diagnostic artifacts were found during Phase II testing, precluding statements on chronology. Although a stemmed point was found during the Phase I survey, it was manufactured from a purple rhyolite which does not resemble the rhyolite found at Mountaintop II, but resembles that from a nearby ridgetop.

Given its almost complete lack of integrity, the site is not believed to be culturally significant.
