

Phase II and Phase III Archaeological Database and Inventory

Site Number: 18WA446

Site Name: Warner Gap Road

Prehistoric

Other name(s)

Historic

Unknown

Brief Description:

prehistoric short-term camp, lithic quarry/extraction

Site Location and Environmental Data:

Maryland Archaeological Research Unit No. 18

SCS soil & sediment code

Latitude 39.6528

Longitude -77.5429

Physiographic province Blue Ridge

Terrestrial site

Underwater site

Elevation 396 m

Site slope

Ethnobotany profile available

Maritime site

Site setting

-Site Setting restricted

-Lat/Long accurate to within 1 sq. mile, user may need to make slight adjustments in mapping to account for sites near state/county lines or streams

Topography

- Floodplain
- Hilltop/bluff
- Interior flat
- Upland flat
- Ridgetop
- Terrace
- Low terrace
- High terrace
- Rockshelter/cave
- Hillslope
- Unknown
- Other

Ownership

- Private
- Federal
- State of MD
- Regional/county/city
- Unknown

Nearest Surface Water

Name (if any) Little Antietam Creek

Summary Description:

This site was first identified during Phase I surface collections in the vicinity in preparation for the replacement of the existing Reid-Thurmont 138kV electric line with the proposed Allegheny Power System's Ringgold-Liberty 138kV line. Eleven fragmented rhyolite bifaces were found along a slope and an eroding creek bank. Because the integrity of the site was uncertain, and impact to the site could not be avoided during construction, Phase II testing was recommended to ascertain site boundaries, significance, chronology, and integrity.

The Warner Gap Road site (18WA446) is situated along a terrace of Little Antietam Creek and relatively precipitous hillslope. Soils at the site consist of Highfield stony loam, a moderately eroded and very gravelly or channery silt loam.

The Phase II testing strategy centered around first establishing the physical limits of the site. Therefore, 50 X 50 cm shovel test pits were excavated on a 5-meter grid within the area where artifacts were found during Phase I survey. A total of 68 shovel test pits were excavated across the locus. The STPs revealed that the site was confined to a small level area within the proposed transmission line right-of-way, but a rhyolite outcropping consisting of naturally occurring boulders and blocks was located on a steep slope approximately 18 meters to the south. Specifically, the aboriginal artifacts were confined to a small narrow terrace overlooking Little Antietam Creek and in an area where artifacts were found eroding from the creek bank during Phase I survey. The site, therefore, was limited to an approximate 85 square meter area within the project right-of-way. Based on the site size and its location along the narrow terrace, a total of 4 contiguous 1 X 1 meter units were excavated.

A total of 50 artifacts were recovered during the Phase II testing, all by-products of prehistoric quarrying/knapping activities. Of the 50 specimens, 46 were of the local rhyolite, 2 were of quartz, and 2 were of diabase. Since quartz occurs in large blocks at the site, these two modified quartz blocks represent the opportunistic use of the material possibly for tool making. Included in the site assemblage were 8 biface fragments, 20 modified blocks, 20 primary flakes, and 2 diabase hammerstones. The rocks used for hammerstones at the site are known to outcrop in large Triassic dikes in the Middletown Valley east of the site and have been found in abundance in rhyolite quarries also to the east.

The type of cultural material found at this site indicates that the locus was possibly utilized as an encampment for processing rhyolite obtained from a nearby outcropping. Since the majority of the rhyolite appears to be of relatively poor to moderate quality and the site contains only sparse amounts of culturally altered material (in comparison to the available raw material), it is likely that the terrace was only temporarily utilized. This is further supported by the absence of finished tools or diagnostic artifacts. The fact that no features were identified strongly supports the interpretation that the site was used as a transient station.

The site is not believed to be culturally significant.
