

# Phase II and Phase III Project Cover Sheet

All information contained within the individual site database and inventory sheets is solely the work of the researchers and authors noted below. The data provided has been culled from the original site reports noted below and in many cases has been lifted directly from them with little or no editing. The database and inventory sheets are meant to serve as a synopsis of the report findings and a finding aid and are not intended to replace or republish the research of the authors noted below.

## REPORT INFORMATION:

1995 Maymon, J.H. and J.G. Clarke  
Phase II Archeological Evaluation of Site 18FR691, for the Proposed Linganore Creek Waste Water Interceptor, Frederick County, Maryland.  
Submitted to the Frederick County Department of Public Works  
Library ID No: 00006080      Catalog/Shelving ID: FR 113

## Research Firm/Institution:

## Project Details:

Phase I

### Project Justification:

Phase II

Phase II archeological testing was undertaken in preparation for the proposed Linganore Creek Sewer Interceptor Extension, in Frederick County, Maryland. Formal investigations were undertaken in accordance with Section 106 of the National Historic Preservation Act of 1966 in anticipation of application for a wetlands permit from the U.S. Army Corps of Engineers.

Phase III

### Project Objectives:

- Determine the nature, age, and function of the archeological resources at the site.
- Determine the horizontal and vertical boundaries of the site.
- Determine the integrity of the archeological resources at the site.
- Use the cultural resources at the site to place it in its local and regional context.

## Research Potential:

Site 18FR691 is comprised of a diffuse scatter of prehistoric lithic artifacts. Stratigraphic and archeological data indicate that most, if not all, of the assemblage is in secondary context. It is unlikely that the site (as currently defined) will yield additional significant archeological data. However, the Phase I survey which identified the current site boundaries focused primarily on the environs of a staked pipeline right-of-way. Field archaeologists report a much larger area containing lithic material at this location (see the MHT Walkersville Quad File #7). Additional work may be warranted to determine if the site boundaries need to be expanded, or if the site is the result of the redepositing of small flakes (through flooding events) transported from another site upstream.
